- Methane concentrations E of SS-25 are still elevated (up to 29 ppm). Peak methane values were recorded near two “catch boxes” used to disperse rain water run-off
- Methane levels immediately W and NW of well SS-25 have been decreasing but are still higher than background
- SCAQMD inspectors used a portable TVA-1000 monitor to confirm these findings and complement the LICOR data
- Videos were taken with FLIR cameras to identify the presence of natural gas
